Reflection Questions:

1. Did your estimations reflect the actual effort?

Yes, the story point estimations generally reflected the actual effort required. Higher-point stories such as Upload and Parse Student Resume (5 points) and Check Student Eligibility (5 points) involved more complexity and effort than smaller stories such as Send Offer Notification (2 points). During the sprint simulation, the estimates provided a reasonable indication of the relative difficulty of the work.

2. Was your backlog well-prioritized?

Yes, the backlog was organized according to the importance and impact of the user stories. Stories related to student eligibility and placement applications were treated as important because they are fundamental to the placement process. Prioritizing the backlog helped identify which work should be addressed first and made sprint planning easier.

3. How did your simulated sprint align with your plan?

The simulated sprint generally aligned with the plan because selected user stories were moved through To Do → In Progress → Done to represent development progress. Some stories were completed earlier while others remained in progress or To Do, which demonstrated how work can change during a sprint. The sprint therefore provided a realistic simulation of Agile workflow and progress tracking. The handout specifically instructs students to simulate progress by moving stories through these three stages.

4. What insights did the burndown chart give about your team’s capacity?

The burndown chart showed how the remaining story points changed during the sprint and helped indicate the team's progress toward completing the planned work. It showed that the team was able to reduce the workload as stories were completed, while also highlighting periods where progress was slower. The chart is useful for understanding whether the planned workload is realistic and for estimating the team's capacity for future sprints.
